

## Pediatric Vision Assessment | Part 7

### Description

## Pediatric Vision Assessment | Part 7

DISCLAIMER: This program is for educational purposes, but is not for credit and there is no test. If you would like to take this and receive professional credit, this program is available through [PESI \(click here\)](#).

*In this series on Pediatric Vision Assessment Dr. Charles Boulet talks about vision assessment on children of all ages, from infants through to school years.*

Understanding vision and testing are vital for providing the best care to your clients. This program will help build your 'vision literacy' and understanding of the various elements of vision that may be affecting patients.

Today's children are falling through the cracks of the medical system with little to no support or appropriate follow up for vision related concerns. What you don't know about vision is costing you, costing your clients.

With the broad and deep impacts of vision on daily function – this knowledge will make an immediate difference in your stalled cases. This course will help you determine whether an issue is behavioural, learning or vision related, and what possible treatment options are.

While focusing on paediatrics, this course contains valuable information relevant in the treatments of both adults and children. Concepts, theories, and information provided herein will be applicable and helpful to adult populations as well!
